AIM: How to configure a web page?

Web page configuration:

A. When developing a web page you must first understand the basic structure of the web site:

1. All ways start a web page with the following syntax:
    <!DOCTYPE html>
    this goes on the first line. This" *intro tag*" tells the browser what language it will be reading.

2. Always place this tag on the next line this tag starts the HTML document setting:
    <html> this is called the opening tag.

3.   Always place this tag on the last line this tag ends the HTML document setting:
    </html> This is called the closing tag.
             Please note:
             The code that make up your web page is placed between these two
             tags.

4. Tags that are used to label the heading on your web page are called:
    <Head > </Head > and <title> </title> tags:
    The <Head> tag will hold information that the end user may not always be able to see. The data between these tags are often used by programs such as search engines to perform various tasks.
    The <Title> tags are used to place the name of your web page on the web browser.

5. The content in the body of the web page that will be visible by the viewers called the <Body> tag:
   <body> </body>
   The contents between the body tags will go inside the html tags, and not inside the head tags.

Creating Paragraphs:

Inside the body tags is where you create your paragraphs.

The paragraph also use a pair of tags : <P> </P>

Use one pair per paragraph.

The following illustration demonstrates the basic configuration of a typical web page:

```
<!DOCTYPE html>
<html>
      <Head>
            <title> </title>
      </Head>
            <body>

            </body>
</html>
```

Class exercise:

Create a web page that will contain the two paragraphs listed below.

The web page will be titled: ***The movies***

Sample Paragraph 1

Back when Disney bought Lucas Film, the plan was to make a new "Star Wars" trilogy as well as stand-alone movies set within that universe. Now word has come that the first individual "Star Wars" film may star a familiar little green Jedi.

Sample Paragraph 2

 Disney is hoping to bring out a new "Star Wars" adventure "every two or three years," according to CEO Robert Iger, spin-off adventures starring supporting characters would seem to be a natural complement to the main trilogy. The first episode of that is going to be directed by J.J. Abrams and is tentatively due out in 2015
